                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Circle, Palo Alto, CA 94303, USA
This CDS clone is a part of a collection of human full length expression clones generated by BD Biosciences Clontech and the Harvard Institute of Proteomics. Each CDS has been cloned in two forms: with and without stop-codon (to allow fusion with C-terminal tag). The CDS has been directionally cloned using BD In-Fusion(TM) cloning system between the Sall and HindIII sites of the pDNR-DUAL vector. Additional sequences in the clone: 'ACC' after Sall site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Submitted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Kalnine, N., Chen, X., Rolfe, A., Halleck, A., Hines, L., Eisenstein, S., Koundinya, M., Raphael, J., Moreira, D., Kelley, T., LaBaer, J., Lin, Y., Phelan, M., and Farmer, A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Kalnine,N., Chen,X., Rolfs,A., Halleck,A., Hines,L., Eisenstein,S., Koundinya,M., Raphael,J., Moreira,D., Kelley,T., LaBaer,J., Lin,Y., Phelan,M. and Farmer,A.

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed,

and is derived by analysis of the total score distribution.

Nucleotide sequences encoding the immunogenic peptides may be used as primers and probes in the detection of melanoma cells. Tumour infiltrating lymphocytes capable of binding to the melanoma associated antigen can be cultured ex vivo and returned to melanoma particles, and when radiolabelled, they may be used to identify

                                                                                                                                                                                                                                                                                                      The present invention relates to oligonucleotides encoding polymorphic variants of proteins related to amylases, amyloid proteins, angiopoietin, apoptosis related proteins, cadherin, cyclin, polymerase, oncogenes, histones, kinases, colony stimulating factors, complement related proteins, cytochromes, kinesins, cytokines, interferons, interleukins, c-protein coupled receptors and thioesterases. The present sequence is one such oligonucleotide. The oligonucleotides and the peptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of the proteins listed above. Disorders that may be prevented, diagnosed and/or treated include multifactorial diseases with a genetic component, such as autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes,

The synthetic polypeptides and polynucleotides are referred to as a Savine. The synthetic polypeptide is useful for modulating immune responses preferably directed against a pathogen or a cancer, (e.g., cancers of the lung, breast, ovary, cervix, colon, head and neck, pancreas, prostate, stomach, bladder, kidney, bone liver, oesophagus, brain, testicle, uterus), as potentiating agents. Compositions comprising the polypeptide may be used in the treatment or prophylaxis against viral (such as infections caused by HIV (human immunodeficiency virus), hepatitis, influenza, Japanese encephalitis virus, Epstein-Barr virus and respiratory syncytial virus), bacterial (e.g., infections caused by Naieseria Moranococcal useroschilleria)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a new synthetic polypeptide (I) comprising several different segments of at least one parent polypeptide linked together in a different relationship relative to their linkage in the parent polypeptide to impede, abrogate or otherwise alter at least one function associated with the parent polypeptide and for inducing an immune response against a pathogen or cancer. Also included are a

                                                                                                                                                                                                                                                                                                                      The invention relates to a method of enhancing an immune response against tumour-associated antigens (TAAs), such as GP100 and carcinoembryonic antigen (CEA) in an animal. The method involves priming of the animal with an inducing agent such as tetanus toxoid (TT) or diphtheria toxoid (DT), subsequently followed by administration of an inducing agent-antigen mixture. The method provides the enhancement or augmentation of the immune response to the antigen and/or improves a vaccination protocol by allowing use of less antigen. The immunisation of the animal with tumour-associated antigen is useful for the prophylactic or therapeutic treatment of cancer. The present DNA sequence encodes modified tumour-associated antigen, GP100 related to the invention.

Nucleic acids and proteins of the invention are useful as vaccines for prophylactic treatment of cancer. AAH22004 to AAH322106 and AAB98098 to AAB98206 represent sequence used in the exemplification of the present invention. More specifically AAB98098 to AAB98205 represent peptides derived from gp100; AAH22084 to AAH22097 and AAH22100 to AAH22106 represent primers used in the present invention; AAH22099 represents the plasmid nucleotide sequence comprising the Vaccinia virus H6 promoter and the human gp100 gene; and AAH22098 encodes the human gp100 m protein given in AAB22106.

                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a method for inducing an immune response, CC in an animal, to a tumour antigen (Ag) comprising administering Ag, or cc nucleic acid (I) that encodes it, to a lymphatic site. Cynomolgus monkeys CC (Macaca fascicularis) were injected with a modified form of gp100 antigen CC (a) into the left inguinal lymph node or (b) subcutaneously. Both animals CC of (a) developed a cell-mediated response (indicated by production of cc interferon-gamma from T lymphocytes when exposed to gp100 peptides), but CC only 2 of 4 animals of (b) did so. Also animals in (a) produced a far CC greater antibody response to gp100. The method is used in immunotherapy CC of a wide range of cancers through induction of a specific immune CC response (humoral and cellular) against the tumour antigens. When CC administered to a lymphatic site, Ag (or (I)) induces a stronger immune CC administered to a lymphatic site, Ag (or (I)) induces a stronger immune CC administered to a lymphatic site, Ag (or (I)) induces a stronger immune CC ABB97815 represent peptides derived from gp100 which stimulate interferon CC (IFN)-gamma production; AAH20120 encodes the modified carcinoembryonic antigen (CEA) protein given in AAB97817; and AAB97818 represents a CEA modified antigen CC invention

                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel mechanism or its fragment. The method response in a patient to a target protein or its fragment. The method involves introducing a vector containing a nucleotide sequence encoding a chimeric immunogen comprising a protein processing signal and the target protein or its fragment. The immunogen is produced by the cells and processed so that the target protein or its fragment is presented to the patients immune system and a cellular immune response is initiated. The method and vectors can be used as a form of vaccination and could be used to generate a cellular immune response is the predominant immune response in the patients. This sequence represents a DNA fragment which response in the patient. This sequence represents a DNA fragment which
        Human melanoma antigen gp100 coding sequence.

Peptides of the invention based on the sequence of residues 299-217 of human melanoma antigen gp100, which represents the putative HLA-A2 binding domain, are designed to enhance binding to major histocompatibility complex (MHC) molecules and to enhance immunoregulatory properties relative to their natural counterparts. The mutations in the claimed peptides confer tighter binding to the MHC. These peptides are useful for inducing an immune response in a subject, where they are delivered in the context of an MHC molecule which presents the compound on the surface of an antigen presenting cell. The peptide sequences are useful as components of anti-cancer vaccines and to expand immune effector cells that are specific for cancers characterized by expression of the melanoma antigen gp100. They are useful for diagnosts and treatment of diseases such as cancer, in particular against human melanoma and for antigen gratical and treatment of antigen presents in confident that and the context in particular against human melanoma and for the context of the context in particular against human melanoma and for the context in the contex
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel synthetic compounds useful for stimulating an immune respons a subject and as components of anti-cancer vaccines, are designed enhance binding to major histocompatibility complex molecules -

                                                                                                                                                                                                                                                                                                                                                                                 polynucleotides that encode these compounds, and immune effector cells that have been raised in vitro or in vivo in the presence of an antigen presenting cell (APC) that presents the compound. Such an APC may be the major histocompatibility complex (MHC) molecule. The anti-melanoma compounds are useful for inducing an immune response in a subject, by delivering the compound to the subject in the context of an MHC molecule which presents the compound on the surface of an APC. The anti-melanoma compound is delivered as a polynucleotide that encodes it. The compounds

In particular, the tumour-associated antigen may be gp100. The composition is useful for the treatment of cancer, especially melanoma. The present sequence is the

Nucleic acids and proteins of the invention are useful as vaccines for prophylactic treatment of cancer. AAH22084 to AAH322106 and AAH38808 represent sequence used in the exemplification of the present invention. More specifically AAH38098 to AAH38215 represent peptides derived from gp100; AAH22084 to AAH22097 and AAH22100 to AAH22100 t

The present sequence encodes a savine protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   colon, head and neck, pandreas, prostate, stomach, bladder, kidney, bone liver, oesophagus, brain, testicle, uterus), as potentiating agents. Compositions comprising the polypeptide may be used in the treatment or prophylaxis against viral (such as infections caused by HIV (human immunodeficiency virus), hepatitis, influenza, Japanese encephalitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  immune response against a pathogen or cancer. Also included are a synthetic polynucleotide encoding and a computer system for designing the synthetic polypeptides. The synthetic polypeptides and polynucleotides are referred to as a Savine. The synthetic polypeptide is useful for modulating immune responses preferably directed against a pathogen or a cancer, (e.g., cancers of the lung, breast, overy, cervix, pathogen or a cancer, (e.g., cancers of the lung, breast, overy, cervix, pathogen or a cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a new synthetic polypeptide (I) comprising several different segments of at least one parent polypeptide linked together in a different relationship relative to their linkage in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The nucleic acid encodes cDNA25, a melanoma antigen (MART-1) which is recognized by T-lymphocytes. cDNA25 is a derivative of the melanocyte-melanoma-specific antigen gp100 (see AAR94855). Antigen cDNA25 is a source of immunogenic peptides (see AAR94199) which are optionally modified (see AAR84200-R84211) and used in medicaments, especially vaccines, for the treatment or prevention
              Immunogenic peptide useful in vaccines comprises specific amino of new melanoma antigen recognised by T lymphocytes -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 &XSSSSSSSSXX
&XSSSSSSSSXX
The present invention relates to a pharmaceutical composition which comprises a nucleic acid molecule encoding a tumour-associated antigen and at least one peptide comprising a region corresponding to a putatic cytotoxic T cell, helper T cell or B cell epitope of a tumour-associate
                                                                                                Pharmaceutical composition useful for treating cancer, comprises nucleic acid molecule encoding tumor associated antigen and peptide comprising a region corresponding to epitope of tumor associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 2172
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       melanoma, and for in vivo tumour recognition and rejection. AAS45524 AAS45528 represent MART-1 coding sequences, PCR primers, and related sequences of the invention.
                                                                                          comprising a antigen -

                            Nucleotide sequences encoding the immunogenic peptides may be used as primers and probes in the detection of melanoma cells. Tumour infiltrating lymphocytes capable of binding to the melanoma associated antigen can be cultured ex vivo and returned to melanoma particles, and when radiolabelled, they may be used to identify

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      antigen and/or cells pulsed with such peptide(s). In particular, the tumour-associated antigen may be gpl00. The composition is useful for treatment of cancer, especially melanoma. The present sequence is the murine gpl00 coding sequence.
                                                                              Immunogenic peptides derived from the melanoma associated antigen (See AAR78639-45) may be used in the production of vaccines.
                                                                                                                                                                                                                                                                                                                                                                                           sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     460

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pred
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Alignment Scores:
          The invention relates to detecting (M1) granulocyte (GC) activation (GCA), by detecting the level of expression of gene(s) (GS) identified by (GCA), by detecting the level of expression (gene(s)) (GS) identified by DNA chip analysis as given in the specification, and comparing the expression level in an unactivated (GC) where differential expression of GS is indicative of GCA. Also included are modulating (M2) GA by contacting GC with an agent that alters the expression of at least one gene in Gs; (2) screening (M3) (For an agent capable of modulating GCA or an inflammation (especially componic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease using the Gene expression profile; (3) detecting (M4) an inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by detecting the complex of expression in a sample of the tissue of gene(s) from GS, where the level of expression of the gene is indicative of inflammation; (A) treating (M5) an inflammation (especially chronic) or in a tissue, an allergic response in sindicative of inflammation; (A) treating (M5) an inflammation (especially chronic) or in a tissue, an allergic response is indicative of inflammation; (A) treating (M5) an inflammation (especially chronic) or in a tissue, an allergic response is indicative of an athogen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            rheumatoid arthritis; glomerulonephritis; asthma; thrombosis; cardiac reperfusion injury; renal reperfusion injury; ARDS; adult respiratory distress syndrome; inflammatory bowel disea Crohn's disease; ulcerative colitis; periodontal disease; granulocyte activation; chronic inflammation; allergy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Local Similarity:
                                                                                                                                                                                                                                                                                                                                                       Claim 1; SEQ ID No 68; 114pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                              Detecting granulocyte activation by detecting differential expression of genes associated with granulocyte activation, which serves as diagnostic markers that is useful for monitoring disease states and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI; 2002-435328/46.

CC transcription and addition of polyadenylated ribonucleotides to a 3' end CC of the mRNA molecule; and (2) determining a level or pattern of a CC molecule in a bovine cell or tissue comprising: (a) incubating a marker CC nucleic acid (comprising any of the 15112 nucleic acid sequences or its CC complement or fragment) with a complementary nucleic acid molecule CC complement or fragment) with a complementary nucleic acid molecule CC dather nucleic acid and the complementary nucleic acid permits the CC marker nucleic acid and the complementary nucleic acid permits the CC complementary nucleic acid, where the detection of the molecule; and (b) detecting the level or pattern of the CC complementary nucleic acid is predictive of the level or pattern of the CC complementary nucleic acid is predictive of the level or pattern of the nucleic acid is predictive of the level or pattern of the molecule.

CC The LMFD nucleic acid is used for determining a level or pattern of the molecule in a bovine cell or tissue. It is useful for genome CC mapping, gene identification and analysis, cattle breeding, preparation constructs for use in cattle gene expression, or for genetically constructs for use in cattle gene expression, or for genetically constructs for acttle. The present sequence is one of the 15112 bovine CC LMFD EST (expressed segmence teal nucleic acid as the constructs are nucleic acid as the constructs are nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  lactation or muscle and fat deposition (designated price), controlled to from cattle, and the LMFD nucleic acid can specifically hybridise to second nucleic acid molecule comprising any of 15112 nucleotide second nucleic acid molecule comprising any of 15112 nucleotide sequences, appearing as ABX34836-ABX49947, or complements of them. Also included are; (1) a transformed cell having a nucleic acid also included are; (1) a transformed cell having a nucleic acid
                                                                                                     Note: The present sequence was not shown in the specification was obtained in electronic format from the USPTO web site: seqdata.uspto.gov/sequence.html?DocID=20020137139.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Also included are; (1) a transformed cell having a nucleic acid comprising an LMFD nucleic acid linked to a promoter and a 3' non-translated sequence that functions in the cell to cause termination of
                                                                                                                                                                                                                                                                                              improving cattle. The present sequence is one of MFD EST (expressed sequence tag) nucleic acids.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activiny inhibin activity and may be useful in the diagnosis and/or restreet for the polypeptide was full in the diagnosis and/or restreet for activity and may be useful in the diagnosis and/or restreet.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          No.:

The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and potentially preventing breast cancer. The polynucleotides and encoded
                                                                                                                                                                                                                                                                                                                          04-FEB-2000;

```

```
CC amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic cativity, and can be used in gene therapy and vaccine production. (I) cyroteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expression in a patient's genome that affect the patients own production of (I). Additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting the mucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, and cancer metastases of haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic-derived cells. AAK64703

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
